attrition patterns. Secondly, overall attrition percentages were calculated for individual ships and for classes of ships and these attrition percentages were then examined for differences using statistical techniques. An ANOVA model using transformed data proved accurate in explaining attrition variance. Lastly, a comparison between attrition per month and underway hours per month was made for classes of ships and for individual ships of three specific classes. A rough relationship was observed, for certain classes of ships, between peaks of high underway hours and peaks of attrition. In looking at individual aircraft carriers, the attrition percentage seemed to be inversely proportional to underway hours per month. Several of these findings warrant further investigation so that the Navy may more fully understand it attrition problem and thereby take steps to alleviate it.

ABSTRACT

This thesis was conducted to analyze certain factors effecting first-term attrition from U.S. Naval ships. The Survival Tracking File (STF) was used as the primary data source, and from it files were constructed that permitted three areas of study. First, the overall cohort of a year's worth of first term enlistees was examined. The survival curve for the cohort was generated and individual monthly cohorts were examined for attrition patterns. Secondly, overall attrition percentages were calculated for individual ships and for classes of ships and these attrition percentages were then examined for differences using statistical techniques. An ANOVA model using transformed data proved accurate in explaining attrition variance. Lastly, a comparison between attrition per month and underway hours per month was made for classes of ships and for individual ships of three specific classes. A rough relationship was observed, for certain classes of ships, between peaks of high underway hours and peaks of attrition. In looking at individual aircraft carriers, the attrition percentage seemed to be inversely proportional to underway hours per month. Several of these findings warrant further investigation so that the Navy may more fully understand it attrition problem and thereby take steps to alleviate it.

I. INTRODUCTION

A. PROBLEM

One problem in the Navy is that approximately 33 percent of Non-Prior Service (NPS) males recruited into the Naval Service in 1973 did not make it through their first enlistment [Ref. 1]. This was part of a spiraling trend in which Navy attrition rates for first-term non-prior service male recruits increased from 30 percent in 1971 to over 40 percent in 1977 [Ref. 2]. When one stops to consider that the cost of recruiting just one of the 86,000 men recruited in 1977 was between $1,700.00 and $2,220.00 [Ref. 3], the loss of 33 percent of these men resulted in the waste of over 55 million dollars in recruiting costs alone. When the costs of training, pay and allowances, transportation, dependent benefits, medical services, etc., are added to the cost of recruiting, the monetary cost to the Navy, when a man fails to complete his enlistment term, is astronomical. A high attrition rate is damaging to the Navy in other ways also.

The Navy is critically short of manpower, especially for certain seagoing billets. It cannot hope to alleviate this shortage when it loses a third of the people it recruits. This shortage of manpower is not a problem that shows promise of an early solution. Despite a downward trend in planned manning levels, recruiters have been pressed to meet accession goals [Ref. 4, 5]. In addition, the pool of recruitable personnel is projected to decrease from 15 to 20 percent during the 1980's. In contrast, an increase in Naval strength and missions is assured with

the new administration's commitment to improving the United States' defense posture. The very real possibility of a 600-ship navy brings with it a staggering manpower requirement. Where the Navy will be able to get this manpower remains to be answered, but lessening the problem of attrition is one avenue. Reducing attrition increases the supply of manpower that is already trained and initiated into the Navy.

Recent attrition studies indicate that the first term attrition rate may be stabilizing at somewhere between 26 and 30 percent [Ref. 4]. The Navy, however, is going to have difficulty competing for eligible recruits to begin with [Ref, 6], and can hardly afford to lose over one quarter of those it does manage to recruit.

B. BACKGROUND

The problem of attrition has been recognized in the upper levels of management in the Navy and Defense. Many varied and innovative methods have been developed to attempt to alleviate this problem.

Screening of new recruits has been occurring for as long as the Navy has been operating and entails attempting to predict and screen out those individuals who have an unacceptably high probability of attrition during a first enlistment. Some of the screening methods that have been used are described in the following paragraphs.

In 1973, the Odds for Effectiveness - 1 (OFE-1) tables were placed in use in an attempt to use four predictor variables as indicators of attrition potential. The four predictor variables were: (1) an aptitude test score, the Armed Forces Qualification Test (AFQT), (2) years of education completed, (3) number of expulsions or suspensions from school, and (4) number of arrests [Ref. 7]. Recruiters found OFE-1 difficult to

use because of the increasing problem of obtaining arrest information due to the privacy act. The Naval Personnel Research and Development Center formulated a revised OFE table, OFE-2, which did not include the number of arrests as a predictor variable. OFE-2 was formally implemented in October 1975 [Ref. 8]. A new screening table involving different predictor variables was developed by Robert F. Lockman of the Center for Naval Analysis (CNA) in 1976. The following predictor variables were used in Lockman's model: (1) *race--majority and minority*, (2) mental group determined using the AFQT, (3) age at entry, (4) dependent status, and (5) years of education [Ref. 9]. Other preservice predictor variables were examined by Lockman and found not to be statistically significant in predicting attrition and hence were left out of his SCREEN (Success Chances for Recruits Entering the Navy) table.

Other studies have begun to investigate early-service variables and to evaluate their effect on attrition. J. S. Thomason of CNA looked at the effects of recruit training camp and first duty station assignment as well as the preservice characteristics investigated by Lockman [Ref. 1]. In addition, Smith and Kendall (1980) looked at A-School[1] training and early service characteristics in their study of a voluntary out program.[2] These studies showed that early-service or post-recruitment variables such as "boot" camp location and first duty station assignment had a significant effect on first term attrition. Both Smith and Kendall

---

[1]A-schools are Navy schools designed to give rudimentary training to new personnel in specific technical and skill-oriented Navy ratings.

[2]The Voluntary Out Program II (Vol. Out II) was an experiment to determine the effects on performance and attrition of allowing recruits to leave the Naval Service upon request, subject to certain requirements.

and Butcher (1980) noted lower first term attrition for those recruits assigned to sea duty versus those assigned to shore duty.

Other initiatives have also been taken to attempt to reduce first term attrition. Among them are raised discharge standards to make administrative discharges more difficult [Ref. 5], and programs like the Behavioral Skills Training Program (BEST) [Ref. 10]. At the Navy's Recruit Training Centers (RTCs), Special Training Divisions (STDs) have been in place for some time. In addition to units that are designed to offer remedial training to recruits deficient in academic, military, or physical training, or to hold recruits with medical problems or awaiting reassignment, the STD has another purpose. Through the Positive Motivation Unit (PMU), using individual counseling, training, evaluation, and processing, the Navy attempts to motivate recruits toward a successful enlistment term. It can be concluded that the Navy is endeavoring to reduce attrition in basic training [Ref. 11].

C. PURPOSE

A great deal of effort is and has been expended on determining the causes of attrition and in developing methods for reducing it. The majority of this research has concentrated on traditional individual and demographic data and on service versus civilian pay opportunities. Only recently has effort been expended in the areas of post recruitment organizational factors [Ref. 4, 1, 12], and on dynamic factors such as working conditions, organizational experiences and supervisory practices [Ref. 13]. To understand and ultimately reduce attrition, one must first discover what factors affect it and where it occurs. It is the purpose of this thesis to look at some of factors which might affect attrition

and to determine if, in fact, there is room for further study using these factors.

Considerable informal debate occured concerning the effect on attrition and retention of the following factors: sea duty, ship class, individual (intra class) ship differences, ship deployment schedules, sea/shore rotation, commanding officers, command climate (leadership), and individual ship retention efforts. Most people agree that these factors affect attrition, but no effort has apparently been made to determine how or if they really do impact attrition, and if they do impact attrition, to what extent.

This thesis will examine a few of these factors in an effort to determine if these factors have any effect on attrition. First, it will examine the Survival Tracking File (STF) cohort which is used as the primary data input for this study. The STS cohort is described in the next chapter. This examination will yield an overall view of how the cohort behaves. The thesis will examine next the overall, first term attrition figures for various ships of the same class for a specific period, and will also examine attrition rates for different classes of ships over the same period in an attempt to determine if class of ship, or hull number within a class, have an impact on attrition. Finally, an attempt will be made to compare attrition histories per month for selected ships and ship classes over time, to underway hours for the same ships and classes over the same period. This will be a very rough attempt to look at the factor of percent of underway time and its relationship to attrition.

II. DATA

A. SHIP DATA BANK

A Ship Data Bank was prepared by LCDR D. Gardner at the Naval Postgraduate School in 1980. He started with a Unit Identification Code (UIC) tape supplied by NMPC-47 (Navy Military Personnel Command, Code 47). The UIC tape contained the UIC, hull number, name, homeport, and type activity code (TAC) for every activity in the Navy, both ships and shore stations. LCDR Gardner then produced punch cards containing the data from the tape for each ship in the fleet and added additional data pertaining to the ship type, class, sub-class, size (based on personnel), age (based on commissioning date), engineering plant, nuclear capable status, homeport location, and active or reserve status [Ref. 4]. A description of the data found in the SHIP DATA BANK FILE is found in Appendix B.

B. ENLISTED SURVIVAL TRACKING FILE

The Enlisted Survival Tracking file (STF) produced by the Naval Personnel Research and Development Center (NPRDC) was used as the basic data cohort for this research. The portion of the STF accessed for this study was received from NMPC-164 (Mr. Kenneth Gay). This cohort was defined by the following characteristics:

1. First term Navy enlistees.
2. Term of enlistment from three to six years.

3. Active duty start date from the beginning of the fourth quarter of fiscal year 1977 (1 July 1977) through the end of the third quarter of fiscal year 1978 (30 June 1978).
4. STF was updated through the end of the first quarter of fiscal year 1981 (30 December 1980).

Development of the STF was initiated by the Bureau of Naval Personnel in 1975. In 1977, NPRDC and Pers 35-b (now NMPC-164), collaborated to complete development of the data base. The STF consists of two separate collections of records. Only the first, the longitudinal STF (STF-L), was utilized for this research effort. It consists of a 120-character field length record which represents the status of each individual at quarterly intervals. The data utilized in the construction of the file are derived from the end-of-quarter Enlisted Master Record (EMR) files and the quarterly audit trail file, both of which are routinely prepared by NMPC-165. The STF-L file contains records commencing with the fourth quarter of fiscal year 1977, and contains a complete longitudinal description for those personnel who enlisted in that calendar quarter or later. For individuals enlisting prior to that time, data are available only from that date (quarter four, FY 77) forward. A completely new record is generated for a person who has a status change during any quarter on one or more variables. An individual could conceivably have a record for each calendar quarter of service. If no change occurs in a quarter, the quarter count variable is incremented indicating the number of calendar quarters the record has remained unchanged. A complete listing of the STF-L data elements is located in Appendix A [Ref. 14].

C. FLEET STEAMING HOURS REPORT DATA

Each month, all U.S. Navy fleet units are required to submit a Fleet Steaming Hours message report to the Navy Maintenance Support Office. This report contains, among other thing, the number of hours the ship has spent steaming underway. This information was used to develop an underway profile for each ship of interest for the period under study. A complete lising of the information available on this tape is contained in Appendix C. The period covered on this tape is four years from January 1977 through December 1980 and contains the information described in Appendic C for all U.S. Naval ships, both active and reserve, which were commissioned during this time. This data tape was obtained from the Commanding Officer, Naval Material Support Office, P.O. Box 2010, Attn: Mr. Larry Giese (Code 022), Mechanicsburg, PA 17055. Updates of this tape can be obtained by contacting Mr. Giese.

III. METHODOLOGY AND DATA MANIPULATION

A. SHIP CLASS UNIT IDENTIFICATION CODE FILE

For this paper, a Ship Class Unit Identification Code File was developed from the Ship Data Bank File prepared by LCDR Gardner for his thesis at the Naval Postgraduate School. Beginning with the Ship Data Bank File (see Appendix B), the file was edited to group all ships by class. The ships were then sorted by class, subclass, hull number, and Unit Identification Code (UIC) and all reserve ships were included. This resulted in a total of 554 U.S. Naval ships broken down into 39 classes as per Appendix D. This file includes both blue and gold ballistic missile (nuclear) submarine (SSBN) crews as separate ship UIC's and some ships that have since been decommissioned. It includes both active and reserve commissioned ships. The ships were then sequentially numbered from 100 to 654 to aid in Statistical Analysis System (SAS) use later. A complete listing of the Ship Class Unit Identification Code File can be found in Appendix E.

B. SURVIVAL TRACKING FILE MODIFICATION

The Survival Tracking File (STF) described in the Data section of this thesis was modified in several ways to facilitate its use. FORTRAN computer language programs were written to read desired fields, to aggregate them, to operate on them, and to write them to files suitable for further use.

1. Merge Program for Study of Overall Attrition Percentage for Ships and Classes of Ships

The FORTRAN program CARLMRG4 was written to read the basic Survival Tracking File (STF) and write a file from which overall attrition percentages for individual ships and classes of ships could be calculated. Appendix A describes the basic STF file variables from which were chosen certain variables pertinant to this study. Table 1 shows the variables of interest that were identified from the STF for use on this research project and prepared for merging with the Ship Class Unit Identification Code File described in Section A above.

The FORTRAN program CARLMRG4 operated in the following manner: all the ships records were read in from the Ship Class Unit Identification Code File (SCUIC). Then all the records of interest for the first person by Social Security Number (SSN) were read in from the STF. The UIC's of the first record were then checked to see if they contained any of the ship UIC's listed on the Ship Class UIC file. When a match was found, only the last record of an individual with a SHIP UIC was saved. This eliminated information from previous quarters which was not needed. This process continued until all of the UIC's that the first person served on were checked to see if they matched any of the UIC's of ships in the SCUIC. Then the saved records were written into a file along with the ship data information for the particular UIC from the Ship Class Unit Identification Code File. Now, a new record was read in by SSN and its UIC's were checked for ships of the SCUIC. This process continued until all of the records in the STF had been processed. The merged file now contained a one line record of every man in the STF that served on any

TABLE 1

STF VARIABLES IDENTIFIED FOR MERGING

Loss Date of Occurance (Year)	38	2
Loss Date of Occurance (Month)	40	2
Loss Code Navy	42	3

of the ships listed in the Ships Class Unit Identification Code File. This one line record contained information about the individual (see Table 1), and information about the ships he served on (see Appendix B). Appendix F is a complete listing of the FORTRAN program used to merge the files as described in the preceding sentences. It should be noted that a record was written for every ship on which the individual served. This was the only way to ascertain how many of our STF cohort served on a particular ship so that this number could be compared to how many of our STF cohort attrited while serving on this ship. The construction of the STF and the data contained on it precluded other possibly more useful ways of calculating an attrition percentage. These other ways of calculation and ways to achieve them will be discussed later.

2. Merge Program for Study of Attrition Over Time

A different set of information was needed from the STF in order to study attrition over time. A data set was desired that would contain the information necessary to allow a study of attrition over time for the entire cohort, and attrition over time for smaller cohorts based on the individuals' entering month, and attrition over time for ships and classes of ships. Appendix G and Appendix H contain listings of FORTRAN programs CARLMRG7 and CARLUIC. These programs created the needed data set in the following manner. The program CARLMRG7 read in from the STF by Social Security Number (SSN) all the records for an individual. Then a subroutine scanned these records, reading the Current Enlistment Date (CED) (See Appendix A) and Loss Date of Occurrence fields. The CED was transformed into a variable called COHORT, corresponding to the month from one to 43 in which this individual began his enlistment. A cohort

value of one meant the individual began his enlistment in June of 1977; a cohort value of two corresponded to July 1977, and so on. The first time a field was found under Loss Date of Occurrence, three things happened. First, the ATTRIT 0,1 variable (1 = attrite) indicating attrition was set to indicate attrition. Secondly, the Loss of Date of Occurence was read and translated into the corresponding month from one to 43 (i.e., June 1977 to December 1980). This value was placed into the variable LMON indicating loss month. Third, the Unit Identification Code (UIC) that the man was onboard when the loss occurred was written into the variable UIC. In every case, whether an attrition occurred or not, the number of months of service tracked was calcualted and placed in the variable NMON. For ATTRIT values equal to one, NMON would indicate the number of months the individual had spent in the Navy prior to attriting. For ATTRIT values equal to 0, NMON would indicate the number of months the individual had been in the Navy as of the most recent STF update. As in the other merge file, this program forced the investigator to make some assumptions and uncomfortable decisions in order to get a useable file created.

The STF does not have a field exclusively dedicated to attrition in the traditional sense (i.e., attrition meaning prematurely leaving the Navy). One of the purposes of this research was to identify the ship that the man first attrited from or that might have influenced an individual's decision to become an unauthorized absentee (UA), etc. Some of the STF records had several different loss dates along with several last onboard UIC's and loss codes, meaning a scenario such as the following had occurred: the individual had gone UA for several months, been caught

and sent back to a ship; he had gone UA again, been caught, and sent to a shore station where he was eventually processed out of the Navy and added to the attrition statistics. However, this man had been effectively lost to the ship for months--even years--prior to actually being processed out of the Navy, in addition to the fact that the shore station was being "credited" with an attrition whose roots may have been connected with the ship the man was serving on when this sequence of events began. For these reasons, and to avoid counting the man as an attrition every time he had a Loss Date, or in being unable to determine where the man was at attrition initiation, only the first Loss Date of Occurrence was used and the UIC he was onboard at that time was credited with the attrition. This is, of course, a large assumption that probably introduces errors into the file, but the decision was made to proceed in this manner. Because of the shortcomings of the STF in handling this type of situation, this was deemed the best route. However, there is certainly room for other approaches to this problem. Another shortcoming of the STF that could not be circumvented at all was the inability to track accurately an individual from UIC to UIC. There is a field in the STF called "Onboard Transfer Date," but it was sparsely completed, usually only being filled in when the man attrited. Even then, the date was the same as the Loss Date of Occurence and only filled in for the UIC from which the man was attriting. The STF probably suffers, as do most historical tracking files, from large time intervals and low priority in getting the information to the file. Hence, the best way to accurately track a man from station to station would be to use some file such as the Enlisted Master Record (EMR), which is updated more often than once

a quarter,and which would be able to give more timely and accurate information as to where an individual was at a given time than the STF can do by itself. The STF is fairly accurate in reporting that the man did go to a school and the UICs on which he served prior to attriting from a certain UIC on a given date, but as to when the man arrived and departed from the various intermediate UIC's, the STF is of no help. This STF shortcoming resulted in a deficiency in the analysis of attrition over time. Whereas it was possible to determine for each ship when, in the 43 month period, an attrition occurred, it was not possible to determine how many of his cohort peers had been stationed on this ship during this particular month. Hence, a monthly attrition percentage could not be calculated. It was known how many of the overall cohort had served on the ship some time in the three and one half years covered by the STF, but not when during this period they had served on it; hence, an overall attrition percentage was possible (see Section B, 1.) but not one broken down month by month. As mentioned earlier, a more time-oriented file, such as the EMR, will have to be used in conjunction with the STF to address these questions.

After CARLMRG7 had created the five variable files described above from the master STF, it was desired to identify the attritions that had occurred from ships. The FORTRAN program CARLUIC did this and also added all the Ship Data Bank File (see Appendix B) information to the attrition information creted by CARLMRG7. This final file created by CARLMRG7 and CARLUIC (see Appendix G and Appendix H) was called 'MSS. S2987, STF COHRT6. A listing of the variables on the final file and their locations can be found in Appendix I.

C. FLEET STEAMING HOURS FILE MODIFICATION

Appendix C contains a description of the fields contained in the Fleet Steaming Hours Report. All of these data were not needed, however, so two FORTRAN programs were written to create a file that would allow the underway operating hours per month per ship to be compared to attrition figures per month obtained from the file created in Chapter III, Section B, 2. above. FORTRAN Program CARLFUEL read the ship name, period, UIC, and hours steaming underway from the master tape FUELHR. It then wrote these into a file. The FORTRAN program CARLFUEL1 took this file and added the Ship Data Bank File (see Appendix B) information for the UIC's of ships being studied (see Appendix E). This merged file was written into a file called MSS.S2987.FUEL4. Appendix L contains a description of the variables contained in this file and their location on the file. Appendix J contains a listing of FORTRAN program CARLFUEL, and Appendix K contains a listing of FORTRAN program CARLFUEL1.

IV. OBSERVATIONS AND FINDINGS

A. OVERALL VIEW COHORT ATTRITION

Before looking at attrition as related to ships and classes of ships, the overall cohort's attrition characteristics were examined. The cohort's survival function for the 3.5 years in question was calculated and displayed. Then the cohort's attrition history month by month was graphed and, finally, 12 small cohorts, based on enlistment commencement month, were tracked for the 43 month period. It was hoped that any large data based or cohort based anomalies could be detected at this stage. What follows is an explanation of how these cohort characteristics were examined and what was found. Possible explanations will be postulated for what is seen, but the primary purpose of this thesis is to describe and display what was found. Explanations as to why situations existed, or attempts at predicting trends or outcomes, contain enough subject material for many future theses.

1. Overall Cohort Survival Function

The Statistical Analysis System (SAS) was used as the primary analysis tool for this thesis. To calculate a cohort survival function, SAS was used to sum up the values for the variable ATTRIT over the entire COHRT6 file by LMON (loss month). These sums were then aggregated over the 43 months and subtracted from the cohort's beginning total of 94,174 individuals on a monthly basis. Appendix M lists the SAS program which generated the Survival Function graph from the numbers calculated as described above. Figure 1 shows this cohort survival function.

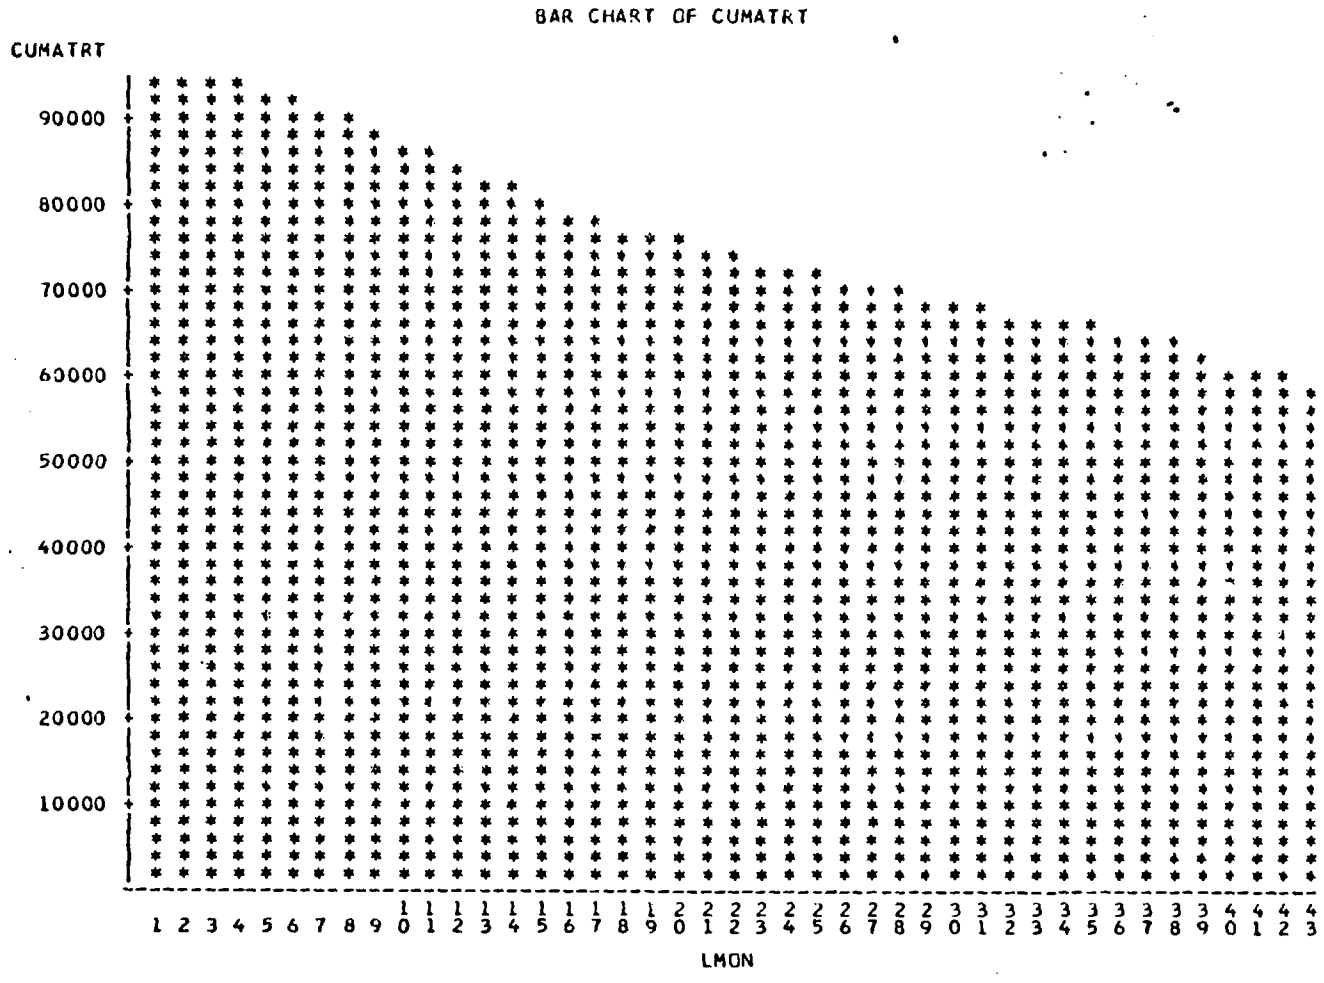

Fig. 1. Overall Cohort Survival Curve

Figure 2 shows the same function with an expanded, but truncated, vertical scale. Both figures show a fairly smooth attrition curve over time. Figure 2 indicates that for this cohort attrition is fairly linear over time with a steeper attrition slope at the beginning of the period of the enlistment and again at the beginning of the fourth year.

2. Overall Cohort Attrition History

SAS program CARLCHT2, contained in Appendix N, summed up the number of attritions by LMON (loss month) and created a bar graph to display them (see Figure 3). Figure 3 shows again the cohort attrition trend in Figure 2--high attrition in the early portion of the period followed by relatively constant lower attrition figures, capped by an increase in attrition numbers as the cohort begins its forth year.

3. Individual Monthly Cohort Attrition History

Appendix O contains SAS program CARLCHT4 which was used to create a graph of the attrition histories of 12 small cohorts. The program created 12 cohorts based on the month the individual began his enlistment. These 12 different cohorts were then tracked month by month for the remainder of the 43 month period. By sliding the time scale forward a month for each successive cohort chart, it is possible to compare attrition rates one month after commencement, two months after commencement, etc., across all twelve cohorts. Any monthly group displaying vastly different attrition profiles will stand out. Recurring trends will also be in evident. Appendix P contains a sample output of CARLCHT4. Several interesting trends are evidentin that output. First of all, cohort 1 (enlistment commencement in June 1977) had less overall attrition than

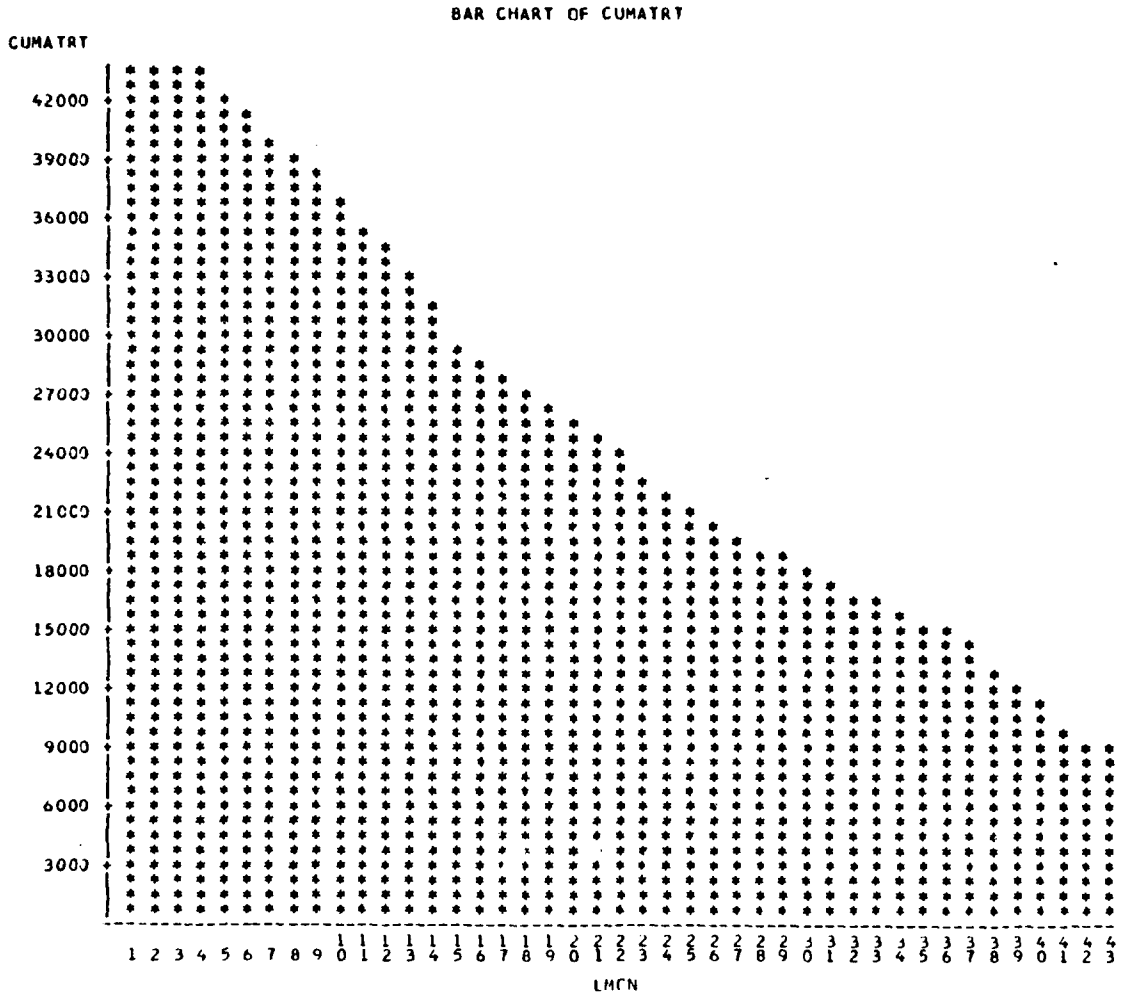

Fig. 2. Expanded Scale Survival Curve

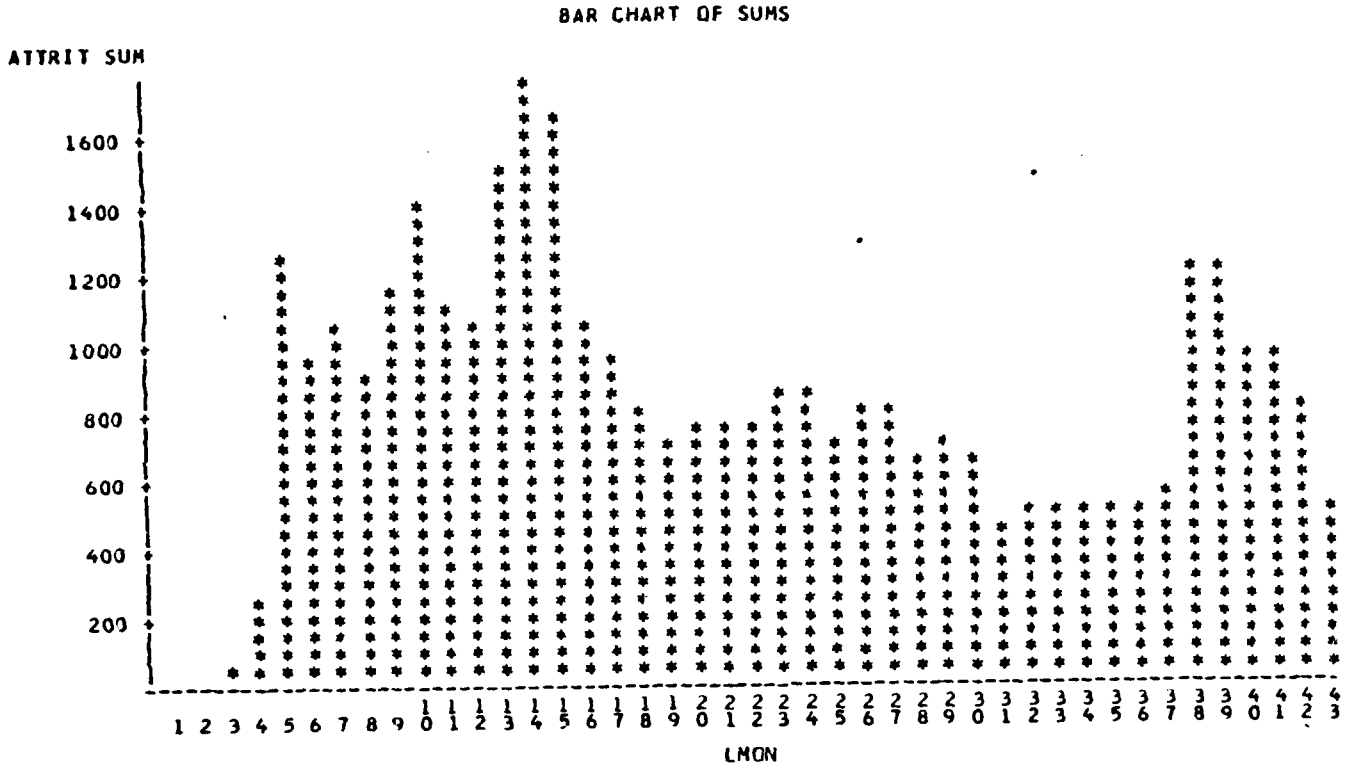

Fig. 3. Overall Cohort Attrition History

did succeeding cohorts. This is probably data induced as the STF was just being implemented at this time and reporting and updating procedures were probably not fully adequate. Beginning with cohort 3, two distinct attrition peaks manifest themselves and are evident in all of the remaining cohorts. These peaks occur in the one to three month period after enlistment and again at the 34 to 38 month period after enlistment. Recruit basic training attrition would seem to explain the first peak at one to three months after enlistment commencement, as this coincides with "Boot Camp" training, but the reason for the second peak is not clear. The second peak is the cause of the steeper attrition slope evident in the end of the survival function curve, and indicates an increase in attrition numbers as the cohort began the last quarter of their enlistment. Why did these men attrite in greater numbers when they only had about one year to go on their enlistment?

B. OVERALL ATTRITION PERCENTAGES

This portion of the thesis utilizes the STFUIC4 file created by the FORTRAN program CARLMRG4 (see Appendix F and Chapter III, Section B, 1) to examine overall attrition percentages for individual ships and for classes of different ships. This section also contains an analysis of variance (ANOVA) and a Duncan Multiple Range Test of intra-class attrition percentage differences.

1. Attrition Percentages for Individual Ships Grouped by Class

It was desired to display attrition figures for each ship grouped by class for the entire 43 month period so comparisons could be made among ships of the same class. It was also desired to calculate

the attrition percentage of each ship and its contribution to the overall attrition percentage and display it in tabular form by ship grouped by class. SAS programs CARLCHRT and CARLFREQ do this. CARLCHRT calculates the number of attritions per ship and displays them graphically for each ship grouped by class. CARLFREQ calculates the overall attrition percentage for each ship and it also displays for each ship the number of STF cohort members who served on each ship, the number of members who attrited from each ship, and the ship's contribution in numbers and percentage to the fleet-wide attrition percentage. These individual ship tables are grouped by class for easy comparison. CARLFREQ accomplished the above by searching for a Loss Date of Occurrence Code in each record of the merged file. The existence of a loss code in the merge file mean that this individual had attrited from the Navy while serving on this particular ship. The loss code (LCODE) was coded 0 if no loss code was present (i.e., the man was still in the Navy while he was on this ship) and coded 1 if a loss code was present (i.e., the man attrited from the Navy while serving on this ship). The merge file UIC4 was then sorted by class and then by ship within that class using the sequence code earlier added to the Ship Class Unit Identification Code File. Now the number of men from the STF cohort on each ship was counted (N). The number of men from the STF cohort who attrited from each ship was counted (SUM) and the percentage of attrition was calculated by dividing SUM by N. Appendix Q contains a complete listing of the SAS program CARLFREQ used to accomplish the above.

Appendix R contains a listing of SAS Program CARLCHRT described above and a display of overall ship attrition grouped by ship class. A

sample of this output is contained in Appendix S. The table of ship attrition percentages grouped by class created by the SAS program CARLFREQ is contained in Appendix T and shows measurable differences in attrition percentages among ships of different classes and also between ships of the same class. More will be said in the next two sections about the statistical significance of these class differences in attrition percentages.

2. Attrition Percentages for Different Classes of Ships

The master STF file used in this thesis was a very large STF file so that sample size was not a problem as it was in LCDR Dan Gardner's thesis [Ref. 4], or in later work done on his STF sample [Ref. 5]. The STF used for this research had 94,174 members initially for the full induction year beginning 1 July 1977. The newest member of the cohort had two and one half years of service as of 30 December 1980, while the oldest member had three and one half years of service. The original STF had 609,000 records which resulted in 61,018 records being written on the merge file. This 61,018 included the cohort members who had served on more than one ship. Since one purpose of this research was to analyze attrition by ship, it was important to know how many members of the cohort had served on a given ship at any time versus those who had served on a given ship and attrited while attached to that ship.

Table 2 summarizes the SAS findings by ship class. It shows there are differences in attrition rates among the different ship classes. Appendix U contains the following information: the number of cohort members who served on a given class of ship and did not attrite while an that class of ship; the number of cohort members who attrited while

serving on a ship of that class; a class attrition rate; and the percentage that this class contributed to the overall attrition. Appendix V presents a bar graph depicting attrition rates for each ship class on a 0 to 1 scale (percent divided by 100). Appendix T contains a ship by ship breakdown of cohort members assigned to a particular ship, cohort members who attrited while assigned to that ship, an attrition rate for that ship, and a percentage of overall attrition contributed by that ship. Recall that Appendix S contains a sample of the output of CARLCHRT which is a bar graph which depicts attrition rate on a 0 to 1 scale (percent divided by 100) for each ship. As these appendices are sorted by class, it is easy to compare attrition both in total numbers and relative percentages from ship to ship in the same class. It is evident that some disparities among ships of the same class do exist, but the attrition rates are close to the class average. Table 2 also includes information about the range of attrition within each ship class.

3. Analysis of Variance and Duncan Range Test on Class Attrition Percentages

SAS was again employed to study the differences in attrition percentages among the various classes of ships. Two programs, CARLDAT1 and CARLDAT2, were used to perform an analysis variance (ANOVA) and a Duncan Multiple Range Test on the class attrition percentages. The programs are identical,except that CALLDAT2 uses the following transform on each class attrition percentage prior to comparing them:

```
PERCENT = ATTRIT/ASSIGN
TPERCENT = (SQRT(ASSIGN))*(ARCSIN((2*PERCENT)-1))
```

This transform is a "variance flattening" transform and its effect is

to enhance the differences of the class attrition means allowing a more revealing comparison of class attrition percentages. Table 3 and Table 4 contain the output of the ANOVA for untransformed and transformed class attrition percentages. The untransformed model was not bad, but the transformed model shown in Table 4 of TPERCENT = TYPE (i.e., class) is better in all measures. The F value is much higher for the transformed model indicating that the model as a whole accounts well for the dependent variable's behavior. The significance probability PR > F indicates that the F value is significant and the R-square in Table 4 indicates that almost 75 percent of the dependent variable's variance can be accounted for by the model. Table 5 and Table 6 show the results of the Duncan Multiple Range Test for the untransformed and the transformed data. Table 6 again shows how much better the transformed data shows up the differences in the class attrition percentages. It should be noted that the transformed class attrition percentage has some shifing of order based on means when compared to the untransformed means. This is caused by the large disparity in the number of ships from class to class.

Appendix W contains a listing of SAS program CARLDAT2. Appendix X contains a table displaying by type (class), the number of ships (N), mean, minimum, maximum, and sum for each of the variables, ATTRIT (number of personnel who attrited), ASSIGN (number of personnel assigned), and PERCENT(ATTRIT/ASSIGN). This table is especially useful as it shows by class the range of attrition and the values, comparative magnitude, counts, etc., that influenced the attrition percentage calculation that has been examined.

C. OVER TIME COMPARISON OF ATTRITION HISTORY AND STEAMING HOURS UNDERWAY

As a precursor to further exploritory studies, a graphical cursory comparison between attrition and hours underway was performed. Using the STF COHRT6 file (see Appendix I) and the FUEL4 file (see Appendix L), attrition history was compared to underway hours for classes of ships and for individual ships of three classes.

1. Underway Hours and Attrition Comparisons Among Classes of Ships

SAS program CARLCLS1, listed in Appendix Y, displays class attrition history by loss month. Appendix B8 is an overall class attrition summary table by loss month. Program CARLFHR2 displays class steaming hours underway by loss month. The program is listed in Appendix Z. Sample outputs of these programs, contained in Appendix AA and Appendix B8, are displayed in the same class order and cover the same period of time, i.e., 43 months from June 1977 to December 1980. Some interesting things can be seen by comparing these two graphs. For instance, SSN's (nuclear submarines) show an extremely high operating schedule but have almost no attrition. This is said to be characteristic of nuclear powered submarines which, popular wisdom says, transfer most marginal people before they become attrition statistics. This portion of the Navy also allegedly has enjoyed the cream of the recruiting crop each year. CV's (aircraft carriers) show a very flat constant operating curve of about 262 hours underway per month per CV, yet the attrition history curve shows large peaks at 15 and 38, 39 months. LHA's (amphibious assault ships) have one of the smaller averages of underway hours, 150 hours per month per LHA and also one of the smaller attrition percentages

for large ships--only 8.37 percent compared to 11.45 for CV's and 12.65 for LSD's (dock landing ships) (see Table 2 and Appendix D).

On the other side of the scale is the AD (destroyer tender) which is only underway an average of 64 hours a month, yet it has one of the highest attrition percentages of 12.4 percent. Clearly, no obvious pattern exists, but when more variables are controlled for and the employment of these ships during their underway periods is added, maybe more relationships will be evident. Appendix DD contains a summary of underway hours by class of ship, the mean, standard deviation, minimum, maximum, range, sum, and variance. This is a useful table, especially when compared with Table 2, which summarizes class attrition percentages.

2. Underway Hours and Attrition Comparisons Between Ships of Three Different Classes

SAS Program CAUWCLAS was used to generate from file FUEL4 a ship-by-ship underway steaming hours history for three classes of ships: CV (aircraft carriers), FF (fast frigate), and LST (tank landing ship). This program, which is listed in Appendix EE, also creates a table which displays mean, standard deviation, minimum, maximum, range, sum, and variance of underway hours for each ship of each class. These underway data are compared with attrition history generated for each ship of each class by the SAS programs CAHISTCV, CAHISTFF, and CARHISLST, all of which are contained in Appendix FF. A comparison of these two data sets for ships of the same class is a rought cut at attempting to control for a few more variables by looking at ships with similar crew size, engineering plant, age, weapons suite, mission, habitability, number of cohort members assigned, and maybe even similar cohort distribution functions over time

(i.e., roughly ten members assigned to each ship of this class after six months of service, 20 members/month/ship through the 14th month of service, etc.). Comparisons using these data yield some interesting observations. For example, for CV's, attrition comes in cycles--a period of high attrition followed by a lull of lower attrition. The underway history is similar, with long periods of underway time followed by periods of inport time. These lulls did not exactly coincide, but on several, such as the Ranger (CV 61), the two phases were close, with attrition falling off as the ship neared a long inport period and rising toward the end of the inport period, as the ship neared a period of a great number of hours of underway steaming. A comparison of Appendix U (attrition percentage summary by ship) and Appendix GG (underway hours by ship) yielded a rough relationship between underway ranking and attrition percentage ranking. The three CV's with the highest average underway hours per month had the 3 lowest attrition percentages, and of the four CV's with the lowest average underway hours per month, three of them had the highest three attrition percentages. The fourth was in the middle of the ranking. Table 7 shows this relationship more clearly. These types of relationships, while not necessarily true for all cases, definitely deserve further explanation and should be included in any kind of regression based prediction model. Appendix HH contains a sample of the attrition history for each ship of each class and Appendix GG contains a sample output of the underway hours history for each ship of each class. A sample of the table listing for each ship of each class for the mean, standard deviation, and variance of underway hours is contained in

TABLE 7

ATTRITION VS UNDERWAY HOURS RELATIONSHIP FOR AIRCRAFT CARRIERS

Ship		Attrition Percentage	Mean Underway Hours for Month	Attrition Rank	Underway Hours Rank
Midway	CV 41	1.19	382.8	1	10

Appendix II. The data in Appendix II are most useful when compared to Appendix U, which shows attrition percentages for each ship.

V. CONCLUSIONS

A. SUMMARY

This thesis set out with the purpose of using several data bases, primarily the Survival Tracking File (STF), to explore ship connected attrition. As mentioned in the introduction to this thesis, the U.S. Navy can ill-afford to lose one third of the people it enlists into the Navy, especially in today's Navy with its high dependence on trained personnel. Since the Navy is ships at sea, this study concentrated on some of the many factors that affect shipboard attrition. Unfortunately, getting the available data into files that were useful in looking at ship-by-ship attrition took more time than was anticipated. Also, several data based deficiencies were discovered that made the approach in this thesis rather convoluted. This thesis has served the purpose of creating data file building blocks and illuminating areas of useful pursuit so that more exhaustive research can be made into explaining and predicting some of the attrition differences discovered during the course of this thesis. It is hoped that readers of this thesis will become aware of some of the many promising avenues of further study that were only touched on during this study, and, by avoiding some of the pitfalls described, find ways to make the data files and observations developed in this thesis more useful.

B. RECOMMENDATIONS

This section will attempt to point out some of the solutions to problems encountered during this study, and to indicate some of the many possible avenues open for continuing this type of research.

In updating master data tapes like the STF, Fleet Steaming Hours Report, and the Quarterly Force Employment Schedule (discussed below), the key is to start early. The Fleet Material Support Office was very responsive with tapes arriving in Monterey only a couple of days after requested. The other sources of data took longer to obtain, but OP-13 personnel were very helpful in obtaining and working with the STF. When requesting file updates, be sure to specify what field you want to be used as the key field in delineating the specific time period of interest. This study requested the cohort that entered the Navy from July 1977 to June 1980; however, the STF was created using the Active Duty Service Date (ADSD) which resulted in people with prior service or interrupted service, etc., being included in the data base and having to be separated out later. For this type of study, using the CADD (Current Active Duty Date) along with the ADSD would have avoided some of these problems and would have been a better way to go. It is important to realize that as-of dates only mean that the file was updated on this date and not that all changes that occurred before this date are included on the file. Old files are constantly revised as new data comes in on past events. Only date-of-occurrence dates indicate when an event actually took place.

Consult with Naval Postgraduate School (NPS) computer center personnel before ordering tapes to ensure data tape characteristics are compatible with the NPS computer. Check to ensure the entire tape reads into mass

storage correctly and ensure block size is correctly designated for the logical record length specified in mass storage file Job Control Language (JCL) cards. As mentioned earlier, the STF must be married to a more real-time oriented data base such as the Enlisted Master Record (EMR) for more meaningful attrition studies. The STF as it exists is fine for discrete period studies, but more information as to where a particular cohort member was at a given time is needed to study attrition in a continuous time manner.

C. AREAS OF FURTHER RESEARCH

This thesis suggests many different avenues for further research. One of the most promising ways of exploiting the data files created is to use the tool of multiple regression to develop predicting equations for attrition from ships or classes of ships. Some of the variables that are available and might be included in a regression model are the ship's class-wide attrition percentages, the ship's underway hours, its engineering plant type, its crew size, and its homeport. Use of the Quarterly Force Employment Schedule file described in Appendix JJ would allow the addition of information pertaining to what exactly was the ship doing while underway or in port (i.e., was it deployed to the Western Pacific or undergoing a major overhaul in Long Beach, California?) Other factors that might influence attrition could be explored: for instance comparing attrition to a plot of the tenure of the ship's commanding officers over time could perhaps prove interesting.

Perhaps development of a "Ship Performance Index" based on inspection scores, battle efficiency awards, retention figures, etc., could be

compared to ship attrition figures to see what affect being on a "top" ship has on attrition. Of course, this would be highly sensitive to the makeup of the index used, but maybe it could be shown that achieving measures of "success" are detrimental to attrition and retention. Then the trade-offs between men and mission could be explored. In short, the study of ship-connected attrition involves a large number of variables, each of which merits investigation to determine its impact on attrition to see if there really is a difference in attrition from ship to ship or among classes of ships. The important factors affecting attrition probably involve some combination of pre-service characteristics--like education and family background--taken together with post-enlistment factors--like class of ship assigned to, operational rate, homeport, commanding officer leadership, underway history, ship performance, and morale. Some of these factors are difficult to quantify, but most can be examined and their significance explored. Only when this is done will the Navy understand its attrition problem and be able to attack it effectively. Reducing the current high attrition figure is a relatively low-cost solution to at least part of the Navy's manpower problems. It is an area where even small gains can payoff in large savings to the Navy.

Loss code DOD (Department of Defense)

APPENDIX B

SHIP DATA BANK FILE DESCRIPTION

Count (Sequential Number for SAS Sort Use)

UIC (Unit Identification Code)

Hull Number

Ship Name

Homeport

TAC (Type of Activity Code)

Ship Type
- Class
- Sub-Class

Size (Personnel)

Age (Commissioning)

Engineering Plant

Nuclear Capable

Location

Active/NRF

APPENDIX C

FLEET STEAMING HOURS REPORT DATA FILE DESCRIPTION

Variable	Position	Field Width
Ship		
Type	1	4
Hull Number	5	4
Period		
Year	9	2
Month	11	2
UIC (Unit Identification Code)	13	5
Hours Steaming		
Underway	18	3
Standstill	21	3
Hours Not Steaming	24	3
Diesel Fuel Used (Gals.) Underway	27	8
Diesel Fuel Used (Gals.) Not Underway	35	6
JP 5 Fuel Used (Gals.) Underway	41	8
JP 5 Fuel Used (Gals.) Not Underway	49	6
Others -- Fuel Used (Gals.) Underway	55	8
Others -- Fuel Used (Gals.) Not Underway	63	6

APPENDIX D

SHIP CLASS NAMES

Class	Ship Type Designation	Class Name
1.	SSNB	Ballistic Missile Submarine (Nuclear)
2.	AGSS	Research Submarine Diesel
3.	SSN	Submarine (Nuclear)
4.	SS	Submarine (Diesel)
5.	CVN	Aircraft Carrier (Nuclear)
6.	CV	Aircraft Carrier
7.	CGN	Guided Missile Cruiser (Nuclear)
8.	CG	Guided Missile Cruiser
9.	DDG	Guided Missile Destroyer
10.	DD	Destroyer
11.	FFG	Guided Missile Frigate
12.	FF	Frigate
13.	PHM	Patrol Combatant Missile (Hydrofoil)
14.	PG	Patrol Combatant
15.	LCC	Amphibious Command Ship
16.	LHA	Amphibious Assault Ship
17.	LPH	Amphibious Assault Ship
18.	LPD	Amphibious Transport Dock
19.	LSD	Dock Landing Ship
20.	LST	Tank Landing Ship
21.	LKA	Amphibious Cargo Ship
22.	LPA	Amphibious Transport Ship
23.	MSO	Ocean Minesweeper
24.	AD	Destroyer Tender
25.	AE	Ammunition Ship
26.	AFS	Combat Stores Ship
27.	AG	Missile Test Ship
28.	AGDS	Auxiliary Deep Submergence Support Ship
29.	AGF	Command Ship
30.	AOE	Fast Combat Support Ship
31.	AOR	Replenishment Oiler
32.	AO	Oiler
33.	AR	Repair Ship
34.	ARS	Salvage Ship
35.	AS	Submarine Tender
36.	ASR	Submarine Rescue Ship
37.	ATF	Fleet Ocean Tug
38.	ATS	Salvage and Rescue Ship
39.	AVM	Guided Missile Ship

*Variables are explained in NWP10 (Naval Warfare Publication) entitled Operational Reports.

NOTE: Each quarterly update is classified confidential for the following quarter (i.e., if the tape is current through December 1980 and prepared in February 1981, it will arrive confidential and will remain so until 30 March 1981. To avoid a declassification problem, allow one quarter to elaspe between last update and tape preparation and you will receive an unclassified tape).
